PurpleBeard Coding BootCamp 2021

Midcourse Project

I intend to build a CRUD website, I am not sure of the full details but this is relevant to my current work so I am keep to learn this. I guess I will create an event and have it so people can log there details like:

- Name
- Email
- Password
- Etc..

Where I will sort this data in local storage for this example but in the real world would be posted to a server.

The tricky but that I would like to achieve which I currently do not know how to do is upload an image, not even sure if this is possible without server storage but we will see.

The other aspect that I would like to achieve with the site is to make it 'responsive' i.e. that it changes format/layout in relation to the screen size it is being accessed on.
